

Look at the backing. It's a non-stick surface that won't slide off the bed or table. No more looking for a second kit or replacement components.

Notice the antiseptic hand gel as soon as you unfold it. It's a great way to promote hand hygiene in compliance with INS and CDC standards.

The drape opens so easily; no more struggling to unfold a flimsy drape to establish a sterile field.

*This is so clever. See how the components are all organized in order of use. It makes it a whole lot easier to follow procedure.*

*By putting the supplies in the pockets they're already on the sterile field. No more worrying about supplies falling off and becoming contaminated.*

*Everything is right here in front of you. I can quickly tell if I have all my supplies. I don't have to dig through a kit to see if I have everything I need.*

*See how large the sterile field is. There is plenty of room to add additional components without the risk of contamination.*

*Look at how the wide four pocket design allows customization of components. It's very flexible. Variations in procedure are easily accommodated.*

*The other thing I really like about this system is that it facilitates compliance with less inservicing. Plus, it's compact and easily fits into almost anything.*

**ExCel<sup>AP</sup>**  
**Proven Effectiveness as it Naturally Delineates the Prepped Area**

The combination of isopropyl alcohol and povidone-iodine results in a one-step quick drying antiseptic. It is easier to use than two-step procedures and its fast drying saves time and eliminates the potential for incorrect order of use.

**Apicare Skin Protectant**  
**Multipurpose Film Barrier**

Skin protectant improves dressing adhesion while also protecting the skin from the irritation of repeated dressing changes.
